
(a)
Post-confirmatory acquisition-expression across probe strengths
Training strength
Mean ± 1 SEM
$p = 0.95$; generation 50
relational causal value ΔV_{rel} (fitness units)
probe strength α $(B_P = \alpha B_H)$
(b)
Original prospective confirmation
Separate tests; separate horizontal scales
200 generations; 99% bootstrap confidence intervals
History specificity
30/30 positive
matching-history fitness advantage
Acquisition-expression
30/30 positive
$\Delta V_{rel}(0.4B_H) - \Delta V_{rel}(B_H)$
Equal-distance anisotropy
30/30 positive
$\Delta V_{rel}(\chi = \pi) - \Delta V_{rel}(\chi = 0)$
(c)
Post-confirmatory acquisition-expression development
acquisition-expression contrast
generation
(d)
Post-confirmatory equal-distance anisotropy development
anisotropy contrast
generation
